RISK

jamming mitigation

Pulsit has more than 20 years experience in real-time tracking, fleet management, vehicle telemetry, risk mitigation and mobility solutions

Our Pulstrac Fleet Risk GPRS solution is a comprehensive fleet & risk management solution that is the perfect choice for distribution and transport companies shipping high value goods by road from port to warehouse and distribution centres.

This solution is a full fleet management solution which includes technology for proactive protection of goods in transport against losses due to theft and hijacking where signal jammers are used by syndicates.

This solution has a holistic approach to protect assets, GIT, reputation, brand, loss of income, insurance credibility, contract retention and at the same time offer fleet operators a system to manage their business with real-time tracking, vehicle utilisation, driver performance and KPI management reports.

We have a 24/7 Risk control room to monitor and manage high risk events.

Our control room operators are well trained to deal with emergency events. They are security cleared and comply to Pulsit's strict security standards and operating procedures.

In the event of a hijack or theft incident, an armed response team will be dispatched to deal with the incident, assist with recovery and/or safeguarding of our client's assets and goods.

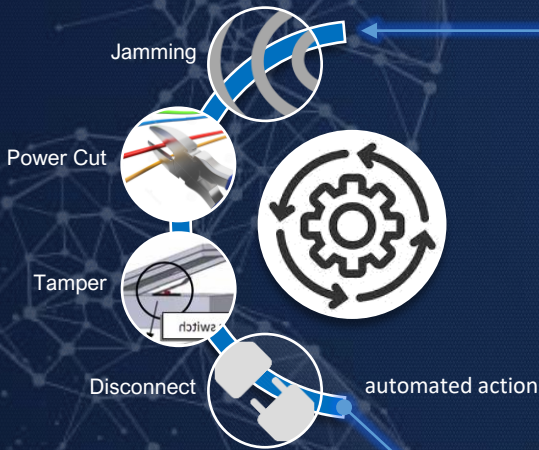

Our Pulstrac Fleet Risk solution is a pro-active system that has been designed to automatically immobilise a vehicle when hijackers either switch on a jamming device inside the vehicle or tamper with the tracking unit.

This prevents them from moving the vehicle and goods away from the last known position and enables our control room operator to dispatch an armed response team to intercept the vehicle and safeguard the assets until the client arrives on scene for a safe handover.
